

Neighbour THM

Attack IP: 10.48.67.55
Target IP: 10.48.140.55

Do a normal scan:
nmap -sV -0 -p- 10.48.140.55

We see port 22/ssh and 80/http open

Lets do a script scan:
nmap -sV -0 -sC -p 10.48.140.55

Nothing much here, lets visit the website
<http://10.48.140.55>

We see a login page and a message saying.
Admin acc is off limits visit guest account.

And when you ctrl+u we can see the cred:
guest:guest

Use that to login.
Now if you press ctrl+u we see this
admin account could be vulnerable, need to update

Now if we look at the url of page it says:
</profile.php?user=guest>

Which indicates that it is vulnerable to IDOR Insecure Direct Object Reference
do this:
</profile.php?user=admin> (replace guest with admin)

And we have our flag.
